Emergency Training Simulator POC

Markdown documentation PDF copy

Message Flow

Source: docs/architecture/message-flow.md

Markdown stays editable. This PDF is the reading/share copy.

Boundary: this project is still a POC, not operational guidance.

Message Flow

This is the main path through the POC.

```
fake/manual trainee
-> TraineeActionEvent
-> API schema check
-> POC input guardrails
-> per-session sequence check
-> deterministic transition
-> ValidationResult
-> ScenarioState
-> append SessionMessage record to JSONL
-> return a client-ready SessionMessage
```

The session manager treats one action as one ordered step. It records the incoming action, validation result, and resulting state together.

Rejected actions are logged too. That way review can show what was attempted, even when the scenario state did not move forward.

Important IDs:

- session_id groups one run.
- event_id identifies one trainee action.
- sequence_number defines the order.
- timestamp helps review, but does not decide the scenario state.
