Boundary: this project is still a POC, not operational guidance.

Wooden Chair POC Object

Status: future asset candidate only. No mesh exists yet.

Use a simple wooden chair as the first environmental-object model when the asset pipeline is tested.

Why this object:

- A chair is common in rooms, stations, training spaces, and public buildings.
- It is easier to justify in emergency-response scenarios than an abstract test object.
- It can later support basic physics checks: collision, tipping, blocking movement, mass assumptions, and object placement.
- It is simple enough to review without turning the POC into an asset-production project.

The current scenario can refer to the chair as environment state, but there is still no generated or approved chair asset.

Physics preview modes

The local demo can show the chair in two static preview modes:

- physics_enabled: false: the chair is visual/context metadata only.
- physics_enabled: true: the chair is marked as a future physics candidate for later collision, tipping, blocked movement, mass, and placement checks.

Neither mode runs a physics engine. No mesh, collision shape, Unreal import, or generated asset exists yet.

Mass is not enough to cover gravity. Mass is only one value a future physics body might need. Real gravity behavior also needs a physics engine, collision shape, object transform, constraints, material/friction settings, and a scene that updates over time. None of that exists in this POC yet.
