Emergency Training Simulator POC

Markdown documentation PDF copy

Demo Script

Source: docs/demo-script.md

Markdown stays editable. This PDF is the reading/share copy.

Boundary: this project is still a POC, not operational guidance.

Demo Script

Use this flow to show the POC without overselling it.

One-command local demo

```
python scripts/run_local_demo.py
```

The script:

1. Checks whether the backend is healthy.
2. Starts a local backend if needed.
3. Runs a happy-path session.
4. Runs a warning/error session.
5. Writes JSONL logs for both sessions.
6. Replays each log to prove deterministic behavior.
7. Prints a sectioned review summary for each session.
8. Shows the wooden-chair environment preview with physics disabled and enabled.
9. Shows whether the chair was moved and whether the entry door was opened.

The happy path moves the wooden chair and opens the entry door before entering the room. The warning/error path tries to enter while an environmental cue is still unresolved, so the backend shows a warning and keeps the state from advancing.

The door's open/closed state matters in the scenario. Door type, lock state, collision shape, mass, hinge side, swing direction, and force directions are metadata only for now.

The physics preview is only metadata. It does not generate a mesh, load an Unreal scene, run gravity, run collision, apply force, or simulate movement.

Keep the disclaimer visible in any demo: this is illustrative POC behavior, not clinical or operational guidance.

The review summary is the main proof point for Dr. Cameron: it should show that the system can explain what happened, not just that the demo ran.
