Markdown stays editable. This PDF is the reading/share copy.

Boundary: this project is still a POC, not operational guidance.

POC Overview

This POC is the first foundation step toward the larger AI-driven emergency-response training platform described in full-project-vision.md.

The POC answers one practical question:

Can a simple trainee action move through the backend and come out as checked, logged, client-ready scenario state?

The current answer is yes, in a small local slice. The backend accepts manual or scripted actions, loads the scenario, applies one deterministic transition, checks the action against POC rules, writes a JSONL log entry, and sends the updated state back over WebSocket.

"Deterministic" just means the same ordered inputs should always produce the same output. That makes the system easier to test, replay, and debug.

Safety boundary

The scenario and rules are software fixtures. They are useful for proving the code path, not for teaching real medical care, firefighting tactics, certification readiness, or field decisions.

Full vision boundary

The larger project eventually points toward AI adaptation, immersive deployment, validation frameworks, trainee sensing, and hub-and-spoke scaling.

Those are future goals.

This repo currently proves the smallest backend loop that those future layers will need.
