Emergency Training Simulator POC

Markdown documentation PDF copy

Instructor/reviewer flow

Source: docs/ux/instructor-reviewer-flow.md

Markdown stays editable. This PDF is the reading/share copy.

Boundary: this project is still a POC, not operational guidance.

Instructor/reviewer flow

This describes the future instructor or reviewer experience.

For the first POC, the reviewer is the most important user.

The reason is simple: if the system cannot explain what happened afterward, it is not very useful for training.

Current POC flow

After a session, the reviewer can inspect:

- actions taken
- final state
- warnings
- errors
- environment cue status
- whether the end condition was reached
- whether replay verification passed

What the reviewer should learn

The reviewer should be able to answer:

- What did the trainee attempt?
- What order did the actions happen in?
- Did the scenario state change?
- Were any environmental cues ignored?
- Did validation return warnings or errors?
- Did the scenario reach an end condition?
- Can the session be replayed consistently?

Current review format

The current review output is organized around:

- session basics
- action timeline
- final state
- environment cues
- warnings
- errors
- key observations
- reviewer takeaways

See review-summary-format.md for the current format.

What the review should avoid

The review should avoid pretending to be:

- clinical evaluation
- certification scoring
- official firefighting guidance
- official EMT guidance
- real-world performance judgment

The review is a POC explanation of a deterministic scenario run.

Good review wording

Good:

The trainee attempted to enter while the entry door was still closed, so the POC validation layer returned a warni

Avoid:

The trainee failed the correct emergency protocol.

The first sentence explains software behavior. The second overclaims.
