Emergency Training Simulator POC

Markdown documentation PDF copy

Trainee flow

Source: docs/ux/trainee-flow.md

Markdown stays editable. This PDF is the reading/share copy.

Boundary: this project is still a POC, not operational guidance.

Trainee flow

This describes the future trainee experience.

Right now, the trainee is represented by manual or scripted actions. There is no real UI, Unreal scene, sensor input, or gameplay layer yet.

Current POC flow

```
scripted trainee action
-> backend receives action
-> scenario state updates
-> validation result is created
-> client receives state update
-> log is written
```

Future trainee experience

Later, the trainee should be able to:

1. start a training session
2. observe a simple scenario
3. notice environmental cues
4. choose or perform actions
5. see the scenario respond
6. finish the scenario
7. receive a review through the instructor/reviewer side

What the trainee should understand

The trainee should understand:

- what scenario they are in
- what phase the scenario is currently in
- what environmental cues are visible
- whether their action changed the state
- whether the system is warning them about a missed cue

What the trainee should not control

The trainee/client should not directly control:

- scenario state
- validation status
- final outcome
- review summary
- replay result

The trainee can attempt actions. The backend decides what happened.

Current example

In the smoke-room POC:

- the wooden chair can block the path
- the entry door starts closed
- the trainee should move the chair and open the door before entering
- ignoring these cues produces warnings or errors

This is not real emergency guidance. It is a software fixture for testing the loop.
