Emergency Training Simulator POC

Markdown documentation PDF copy

UX principles

Source: docs/ux/ux-principles.md

Markdown stays editable. This PDF is the reading/share copy.

Boundary: this project is still a POC, not operational guidance.

UX principles

These are simple design rules for future client and review work.

1. Show state clearly

The user should be able to tell what is happening without reading raw JSON.

Current examples:

- scenario phase
- chair moved or not moved
- door open or closed
- warnings and errors

2. Keep the backend as the source of truth

The UI should display backend state.

It should not invent scenario state on its own.

3. Make warnings useful, not dramatic

Warnings should explain what happened in the POC.

They should not shame the trainee or pretend to be official emergency guidance.

4. Keep the review readable

The review should be clear enough for a human to understand quickly.

A good review should answer:

- What happened?
- What changed?
- What was warned?
- What was blocked?
- Did replay confirm the run?

5. Avoid visual complexity too early

Do not build polished UI before the contract is stable.

Text output and simple debug panels are enough for now.

6. Use honest labels

Use labels like:

- POC rule check
- preview metadata
- future physics candidate
- local demo

Avoid labels that imply production readiness, real medical authority, or real emergency certification.
